Counting with state

Every known name links to its documentation on Hackage, and operators become "ligatures" that still copy as the original text:

```haskell
import Control.Monad.State

-- count the calls of the step function
counter :: Int -> State Int [Int]
counter n = do
  xs <- mapM (\x -> modify (+1) >> pure (x * 2)) [1 .. n]
  k  <- get
  when (k /= n) $ error "unreachable"
  pure (filter even xs)
```

Inline, too: `foldr (+) 0 <$> Just [1, 2, 3]`. And a GHCi session:

```
ghci> :t fmap
fmap :: Functor f => (a -> b) -> f a -> f b
```
